

9/18/13 lecture

- Pairwise & Mutual Independence
- Counting

Mutual Independence:

Recall that A, B independent, $P(A \text{ and } B) = P(A) * P(B)$
Mutual is when:

$$P(A \text{ and } B \text{ and } C) = P(A) * P(B) * P(C)$$

Mutual implies pairwise, but pairwise does not imply mutual

A, B, C are indep. if

$$\begin{aligned} P(A \text{ and } B) &= P(A) * P(B) \\ P(B \text{ and } C) &= P(B) * P(C) \\ P(A \text{ and } C) &= P(A)P(C) \\ \textbf{AND} \\ P(A \text{ and } B \text{ and } C) &= P(A) * P(B) * P(C) \end{aligned}$$

Example

$$\Omega = \{a,b,c,abc\}$$

$$\begin{aligned} A &= \{a,abc\} \\ B &= \{b,abc\} \\ C &= \{c,abc\} \end{aligned}$$

Each of the tickets is equally likely to be selected. What is $P(A)$?

1. Establish that A, B, and C are pairwise independent
2. Show that $P(A \text{ and } B \text{ and } C) \neq P(A) * P(B) * P(C)$

$$\begin{aligned} P(A) &= 1/2 \\ P(B) &= 1/2 \\ P(C) &= 1/2 \end{aligned}$$

$$\begin{aligned} \text{All intersections} &= \{abc\} \\ P(A \text{ and } B) &= 1/4 \\ P(A \text{ and } C) &= 1/4 \\ P(B \text{ and } C) &= 1/4 \end{aligned}$$

$$\begin{aligned} \text{Total intersection} &= \{abc\} \\ P(A \text{ and } B \text{ and } C) &= 1/4 \end{aligned}$$

$1/4 \neq 1/2 * 1/2 * 1/2$, so they are not mutually independent.
However, $P(A \text{ and } B) = P(A) * P(B)$ and so on, so they are pairwise independent.

What the fuck is this

Mutual Independence of $A_1, A_2 \dots A_n$ sets

$A_1, \dots A_m$ if
 $P(\text{Intersection of } A_k \mid k \text{ in } S) = \text{Productsum}(P(A_k))$

S is an element of the Powerset($\{1, 2, \dots n\}$)

A **powerset** is the set of all sets of n sets
Basically, all possible combinations of subsets.
{Empty Set, {1},{2},...{n}, {1,2}, {1,3}...{n,n}, up to {n,n,...n}}

Counting

Discrete uniform probability law

All sample points equally likely

Ω has a bunch of dots in it, with a circle A containing some of them.

$$\begin{aligned} |\Omega| &= n \\ |A| &= n_a \\ P(A) &= n_a/n \end{aligned}$$

Combinatorial Analysis

Fundamental Principle of Counting

A random experiment consists of a sequence of r subexperiments:

$$\begin{aligned} n_1, n_2, n_3, \dots n_r \\ \Omega = \Omega_1 * \Omega_2 * \dots \Omega_r \\ \\ |\Omega_k| &= n_k \\ |\Omega| &= n_1, n_2 \dots n_r \end{aligned}$$

Example

Flip a coin, then roll a 6 sided die

$$n_1=2, n_2=6 \rightarrow n = n_1 * n_2 = 12$$

Example

License plates 3 letters and 4 digits. How many possible choices?

$$26 * 26 * 26 * 10 * 10 * 10 * 10$$

Example

What about with distinct digits and letters?

$$26 * 25 * 24 * 23 * 10 * 9 * 8 * 7$$

Example

What about how many license plates with 3 letters and 4 digits?
Haven't learned this stuff yet!

Example

$$\begin{aligned} A &= \{a, \dots a_n\} \\ P(A) &= \textbf{set} \text{ of all subsets of } A \\ |P(A)|? \\ \text{Answer: } &2^n \end{aligned}$$

n subexperiments, one for each element of A
each subexperiment has two outcomes

- choose for the subset
- not choose it

Permutations

Sample space of n elements. Put them in n bins.
How many ways are there to do it? n subexperiments.

n choices * n-1 choices * n-2 choices 1 choice

number of ways we can order n elements is $n! = n(n-1)(n-2)...(2)(1) = n \text{ factorial}$

verb is **permute**

Example

Roll a six side die six times
 $P(\text{All rolls produce a distinct number})$

$$6/6 * 5/6 * 4/6 * 3/6 * 2/6 * 1/6 = .015432099$$
