6.041/6.431: Probabilistic Systems Analysis (Fall 2011)

Recitation 7 Solutions September 29, 2011

1. (a) The first part can be completed without reference to anything other than the die roll:

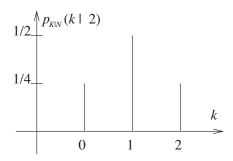

(b) When N=0, the coin is not flipped at all, so K=0. When N=n for $n \in \{1,2,3\}$, the coin is flipped n times, resulting in K with a distribution that is conditionally binomial. The binomial probabilities are all multiplied by 1/4 because $p_N(n)=1/4$ for $n \in \{0,1,2,3\}$. The joint PMF $p_{N,K}(n,k)$ thus takes the following values and is zero otherwise:

	k = 0	k = 1	k = 2	k = 3
n = 0		0	0	0
n = 1	1/8	1/8	0	0
n = 2	1/16	1/8	1/16	0
n = 3		3/32	3/32	1/32

(c) Conditional on N=2, K is a binomial random variable. So we immediately see that

$$p_{K|N}(k|2) = \begin{cases} 1/4, & \text{if } k = 0, \\ 1/2, & \text{if } k = 1, \\ 1/4, & \text{if } k = 2, \\ 0, & \text{otherwise.} \end{cases}$$

This is a normalized row of the table in the previous part.

(d) To get K = 2 heads, there must have been at least 2 coin tosses, so only N = 2 and N = 3 have positive conditional probabilities given K = 2.

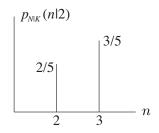

$$p_{N|K}(2\mid 2) = \frac{(\{N=2\}\cap \{K=2\})}{(\{K=2\})} = \frac{1/16}{1/16+3/32} = 2/5.$$

Similarly, $p_{N|K}(3 | 2) = 3/5$.

6.041/6.431: Probabilistic Systems Analysis (Fall 2011)

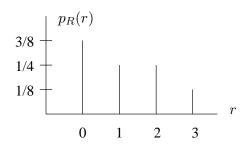

2. (a) x = 0 maximizes $\mathbf{E}[Y \mid X = x]$ since

$$\mathbf{E}[Y \mid X = x] = \begin{cases} 2, & \text{if } x = 0, \\ 3/2, & \text{if } x = 2, \\ 3/2, & \text{if } x = 4, \\ \text{undefined, otherwise.} \end{cases}$$

(b) y = 3 maximizes $var(X \mid Y = y)$ since

$$var(X \mid Y = y) = \begin{cases} 0, & \text{if } y = 0, \\ 8/3, & \text{if } y = 1, \\ 1, & \text{if } y = 2, \\ 4, & \text{if } y = 3, \\ \text{undefined, otherwise.} \end{cases}$$

(c)

(d) By traversing the points top to bottom and left to right, we obtain

$$\mathbf{E}[XY] = \frac{1}{8} \left(0 \cdot 3 + 4 \cdot 3 + 2 \cdot 2 + 4 \cdot 2 + 0 \cdot 1 + 2 \cdot 1 + 4 \cdot 1 + 4 \cdot 0 \right) = \frac{15}{4}.$$

Conditioning on A removes the point masses at (0,1) and (0,3). The conditional probability of each of the remaining point masses is thus 1/6, and

$$\mathbf{E}[XY \mid A] = \frac{1}{6} (4 \cdot 3 + 2 \cdot 2 + 4 \cdot 2 + 2 \cdot 1 + 4 \cdot 1 + 4 \cdot 0) = 5.$$
